Literature Review

In this chapter I will demonstrate some of the extended citation capabilities provided by the Harvard package (Williams and Schnier, 1994). As well as supporting the standard LaTeX \cite command, it provides a few other very useful ones.

The \cite command is best used when placing a citation at the end of sentence or phrase (as above). When you want to refer to the authors of a particular work, typically at the start of a sentence, \cite is not appropriate. This is particularly so if you are using a numerical or symbolic citation style. You should *not* start a sentence with

[2] says that this is most certainly ...

In such situations you really need to give the authors' names. The Harvard package provides a new command \citeasnoun, which allows you to produce things like:

Ade (1983) describes a means by which textures may be characterized ... another approach is given in De Bonet and Viola (1998).

Atick, Griffin and Redlich (1996) note that humans have little or no difficulty in perceiving shape, yet find it extremely difficult to *describe* what they perceive.

Another useful new command provided by the Harvard package is \possessivecite. This is used when you want to use the authors in a possessive sense, as below:

Atick et al.'s (1996) experiments with hundreds of three-dimensional scans of human heads suggests that ...

Note that an abbreviated version of the authors' names has been used above. The Harvard package does this automatically after the first citation. This behaviour can be overridden if desired.

Note: The standard Harvard package is incompatible with `pdflatex` (via the `html` package). If you want to use the Harvard package with `pdflatex`, make sure you use the version supplied here (2.0.5a), which has been hacked to remove the problem.

In the long run, `natbib` is probably the better choice. Watch this space...

Figures and Tables

Here we will test that references to figures and tables work correctly.
